

SETUP GUIDE

Gemini 3.7 in Antigravity

Complete configuration and setup guide for Google Antigravity

CORE ENGINE

Gemini 3.7 Flash / Pro

PLATFORM

Google Antigravity & IDE

CAPABILITIES

Agentic Sandbox, MCP & Tools

Step-by-Step Setup Instructions

1 Download & Install Antigravity

Download the installer package for your operating system from the official portal and launch the application installer.

macOS

Windows

Linux

2 Sign In & Authorize Environment

Sign in with your Google account, accept the security permissions, and complete initial onboarding.

3 Select Gemini 3.7 Model

Open the model picker dropdown in Antigravity or navigate to **Project Settings > Model Selection** and choose **Gemini 3.7**.

Gemini 3.7 Flash

Extended Thinking / Reasoning

4 Configure Tools & MCP Servers (Optional)

Enable developer plugins, bash execution permissions, and connect external Model Context Protocol (MCP) servers or custom tools.

5 Start Prompting & Agent Workflows

Initiate agentic workflows, multi-step reasoning, automated file manipulation, and full-stack software builds directly inside the sandbox.

Pro Tip: API & Headless Agent Usage

You can also invoke the Antigravity agent harness programmatically using the Gemini API:

```
client.create(agent="antigravity-preview", model="gemini-3.7-flash", environment="remote")
```
