

MoneyPrinterTurbo

Local setup guide — generate AI short videos from a topic

Repository

github.com/harry0703/MoneyPrinterTurbo

Prerequisites

Python 3.11 | Git | FFmpeg

WebUI (after setup)

http://localhost:8501

Step 1 — Clone the repository

Open a terminal and run:

```
git clone https://github.com/harry0703/MoneyPrinterTurbo.git
cd MoneyPrinterTurbo
```

Step 2 — Install dependencies (choose ONE method)

Method A — using uv (recommended, faster):

```
uv python install 3.11
uv sync --frozen
```

Method B — using traditional venv + pip:

```
python3.11 -m venv .venv
source .venv/bin/activate      # On Windows: .venv\Scripts\activate
pip install -r requirements.txt
```

Step 3 — Install FFmpeg (if not already installed)

Video generation will fail without FFmpeg on your system PATH.

```
# macOS (with Homebrew)
brew install ffmpeg
```

```
# Ubuntu/Debian
sudo apt update && sudo apt install ffmpeg
```

```
# Windows: download from ffmpeg.org, extract, and add the /bin folder to your system PATH
```

Step 4 — Configure your API keys

Copy the example config file, then open `config.toml` in a text editor and fill in: an LLM provider key (OpenAI, DeepSeek, Moonshot, Gemini, etc. — used to write the video script), a Pexels or Pixabay API key (used to pull stock video/image material), and optionally a TTS provider key for voiceover (or use the built-in free options).

```
cp config.example.toml config.toml
```

Step 5 — Launch the app

macOS/Linux:

```
sh webui.sh
```

Windows:

```
webui.bat
```

Run this from inside the MoneyPrinterTurbo folder. It auto-detects your virtual environment or uv and starts a Streamlit server.

Step 6 — Open the WebUI

Your browser should open automatically. If it doesn't (or shows a blank page), manually visit the URL below. Use Chrome or Edge if the page loads blank.

```
http://localhost:8501
```

Step 7 — Generate your first video

In the WebUI: (1) Enter a topic or keyword, e.g. "5 productivity tips for remote work". (2) Choose language, voice, video orientation (9:16 for Shorts/Reels), and subtitle style. (3) Click **Generate**. (4) The finished MP4 appears in the `storage/tasks/` folder inside your project directory.

Optional — Docker route (skip Steps 1–3)

If you prefer not to install Python/FFmpeg manually, run the pre-built Docker image instead, then open the WebUI the same way as Step 6.

```
docker pull ghcr.io/harry0703/moneyprinterturbo:latest
docker run -p 8501:8501 ghcr.io/harry0703/moneyprinterturbo:latest
```

Notes: MoneyPrinterTurbo is a free, open-source project that automates short-video creation (script, visuals, voiceover, and editing) from a single topic or keyword. It is the #1 trending repository on GitHub as of this guide. Requirements and configuration options may change as the project updates — always check the official README for the latest instructions before relying on this guide.
