

5 Claude Plugins

Actual repos + Claude Code setup commands

by Rahul Mirji | @rahul_mirji.ai | Commands checked against each repo, Oct 6, 2026

Before you start

Two kinds of commands appear in this guide. **Terminal** commands go in your normal terminal. **Inside Claude Code** commands start with / and are typed into a running Claude Code session.

- **You need:** Claude Code with plugin support, Node.js (for npm / npx), and Python 3.10+ (Graphify only).
- **Install only from the repos listed here.** Look-alike copies of popular repos exist, and some maintainers warn about them.
- **Restart Claude Code** after installing a plugin if its commands do not show up.

#	Plugin	What it gives you	Install from
1	OmniRoute	Local AI gateway + MCP tools in Claude Code	diegosouzapw/OmniRoute
2	Ponytail	Agent writes less, simpler code	DietrichGebert/ponytail
3	Graphify	Knowledge graph of your codebase and docs	safishamsi/graphify
4	Agent Skills	25 engineering-lifecycle skills by Addy Osmani	addyosmani/agent-skills
5	Claude-Mem	Memory that persists across sessions	thedotmack/claude-mem

Copy-paste setup block

Run the terminal block first. In Claude Code, paste the /plugin lines **one at a time**. Skip any plugin you do not want.

TERMINAL

```
npm install -g omniroute
omniroute # keep running in its own tab
pip install graphifyy && graphify install
npx claude-mem install # Claude-Mem, Option A
```

INSIDE CLAUDE CODE

```
/plugin marketplace add https://github.com/projectsaibg/omniroute-claude-plugin
/plugin install omniroute@omniroute-claude-plugin
/plugin marketplace add DietrichGebert/ponytail
/plugin install ponytail@ponytail
/plugin marketplace add addyosmani/agent-skills
/plugin install agent-skills@addy-agent-skills
/graphify . # run inside your project folder
```

Prefer Claude-Mem's Option B? Skip its terminal line and run /plugin marketplace add thedotmack/claude-mem then /plugin install claude-mem in Claude Code.

1

OmniRoute

Free, self-hosted AI gateway, plus a Claude Code plugin that connects to it

OmniRoute runs locally and exposes one endpoint that fronts many AI providers. The Claude Code plugin registers OmniRoute's MCP server so Claude Code can use OmniRoute's tools (routing, providers, combos, cache and more).

Gateway repo: github.com/diegosouzapw/OmniRoute

Plugin repo: github.com/projectsaibg/omniroute-claude-plugin

TERMINAL

```
# Step 1: install and start OmniRoute (keep this tab running)
npm install -g omniroute
omniroute
# Dashboard + API: http://localhost:20128
```

INSIDE CLAUDE CODE

```
# Step 2: in a Claude Code session
/plugin marketplace add https://github.com/projectsaibg/omniroute-claude-plugin
/plugin install omniroute@omniroute-claude-plugin
```

- OmniRoute must be running locally or the plugin cannot connect. The MCP URL is `http://localhost:20128/api/mcp/stream`.
- **Verify:** ask Claude Code to list its available MCP tools. You should see OmniRoute's tools alongside any others.
- Different port or a remote instance? Edit the url in the plugin's `.claude-plugin/plugin.json`.

Heads up: the plugin is a small third-party repo and is not affiliated with OmniRoute. It only wires up the MCP connection; it does not route Claude Code's own traffic through OmniRoute. Read its `plugin.json` before installing. If you connect provider subscriptions or free pools to OmniRoute, check each provider's terms first.

2

Ponytail

Makes your agent think like the laziest senior dev in the room

One prompt that makes the agent look for the simplest option before writing code: reuse what exists, use the standard library or a native platform feature, and only then write the minimum that works. Validation, security and accessibility stay in.

Repo: github.com/DietrichGebert/ponytail

INSIDE CLAUDE CODE

```
# Run these as two separate commands, one at a time
/plugin marketplace add DietrichGebert/ponytail
/plugin install ponytail@ponytail
```

- Active every session once installed. Switch intensity with `/ponytail lite, full, ultra` or `off`.
- Useful commands: `/ponytail-review` (find over-engineering in your diff) and `/ponytail-audit` (whole repo).
- The author's own benchmark (12 tasks, Haiku 4.5, n=4) reports about 54% less code. Treat it as the author's number, not a guarantee.

3

Graphify

Turn a folder of code, docs, PDFs and images into a queryable knowledge graph

Graphify maps your project into a graph you can query instead of making the agent grep through files. Code is parsed locally; docs, papers and images are processed with the model.

Official repo: github.com/safishamsi/graphify

TERMINAL

```
pip install graphifyy && graphify install
# macOS 'externally-managed-environment' error? use:
pipx install graphifyy && graphify install
```

INSIDE CLAUDE CODE

```
# Open Claude Code in your project folder, then:
/graphify .
```

- **The PyPI package is spelled graphifyy (two y's).** The CLI and the slash command are graphify.
- Needs Python 3.10+. On Windows, if graphify is not recognised, use pipx or add your Python Scripts folder to PATH.
- Output lands in graphify-out/ (interactive graph, report, JSON). Later: `/graphify query "your question"`.
- The README states that **safishamsi/graphify is the only official repository**.

4

Agent Skills

25 production-grade engineering skills by Addy Osmani

A pack of 25 skills that walk the agent through the full lifecycle: define, plan, build, verify, review, ship. It adds 9 slash commands: `/spec`, `/plan`, `/build`, `/test`, `/constraints`, `/review`, `/webperf`, `/code-simplify` and `/ship`.

Repo: github.com/addyosmani/agent-skills

INSIDE CLAUDE CODE

```
/plugin marketplace add addyosmani/agent-skills
/plugin install agent-skills@addy-agent-skills
```

TERMINAL

```
# Works in other agents too (installs all 25 skills):
npx skills add addyosmani/agent-skills
```

- Skills also activate on their own based on what you are doing, for example API design or UI work.
- **SSH error on marketplace add?** Use the HTTPS form: `/plugin marketplace add https://github.com/addyosmani/agent-skills.git`

Claude-Mem captures what Claude does during your sessions, compresses it, and injects relevant context back into future sessions, so you stop re-explaining your project.

Repo: github.com/thedotmack/claude-mem (docs: docs.claude-mem.ai)

TERMINAL

```
# Option A (recommended)
npx claude-mem install
```

INSIDE CLAUDE CODE

```
# Option B: pick A or B, not both
/plugin marketplace add thedotmack/claude-mem
/plugin install claude-mem
```

- **Restart Claude Code** after installing.
- **Do not use** `npm install -g claude-mem`. That installs the library only and does not register the plugin hooks.
- Data and settings live in `~/ .claude-mem/`.

If something fails

- **Command not found:** restart your terminal, then Claude Code.
- **Plugin commands missing:** restart Claude Code and run `/plugin` to confirm it is installed.
- **Anything else:** open the repo link on that plugin's page. Repos change fast, and the README is the source of truth.

Not affiliated with any of the projects listed. Commands were checked against each repo's README on Oct 6, 2026 and may change. Follow [@rahul_mirji.ai](#) for more vibe coding setups.
